

TEST A, interim 2026-09-13 11:02 HST: $L_0 = 20 \sigma$ ($\eta = 0.196$), divider mass $M = 900$, 25 finished seeds
 Román 2002 estimator: FFT of the divider position from release, largest nonzero bin per seed, mean over seeds

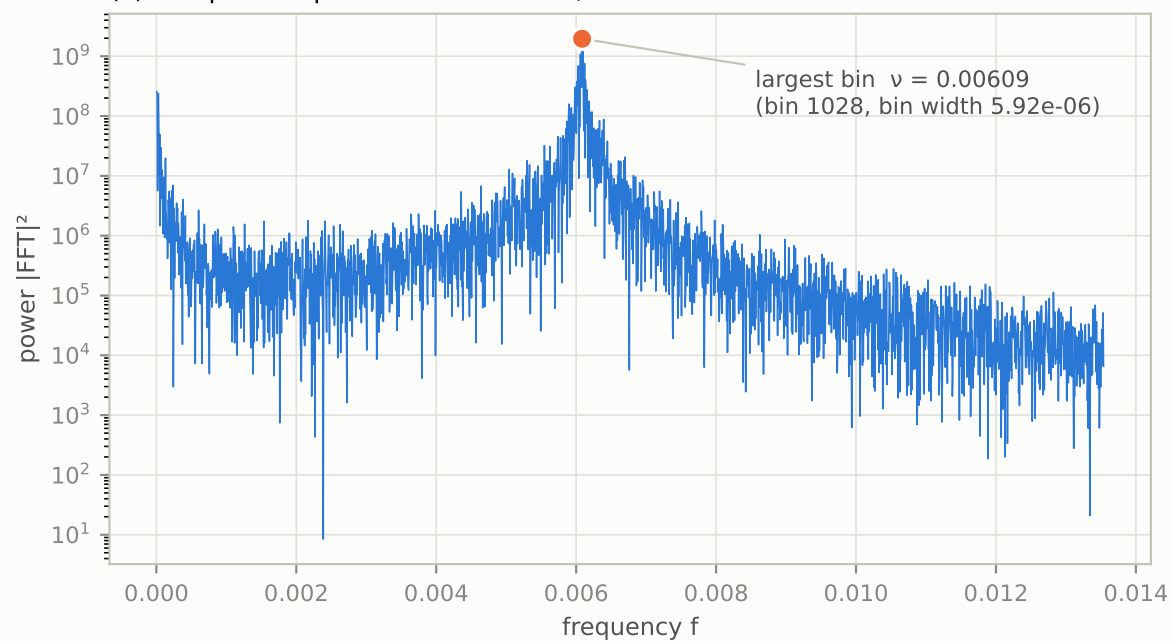

(a) divider position, first 20 oscillations after release

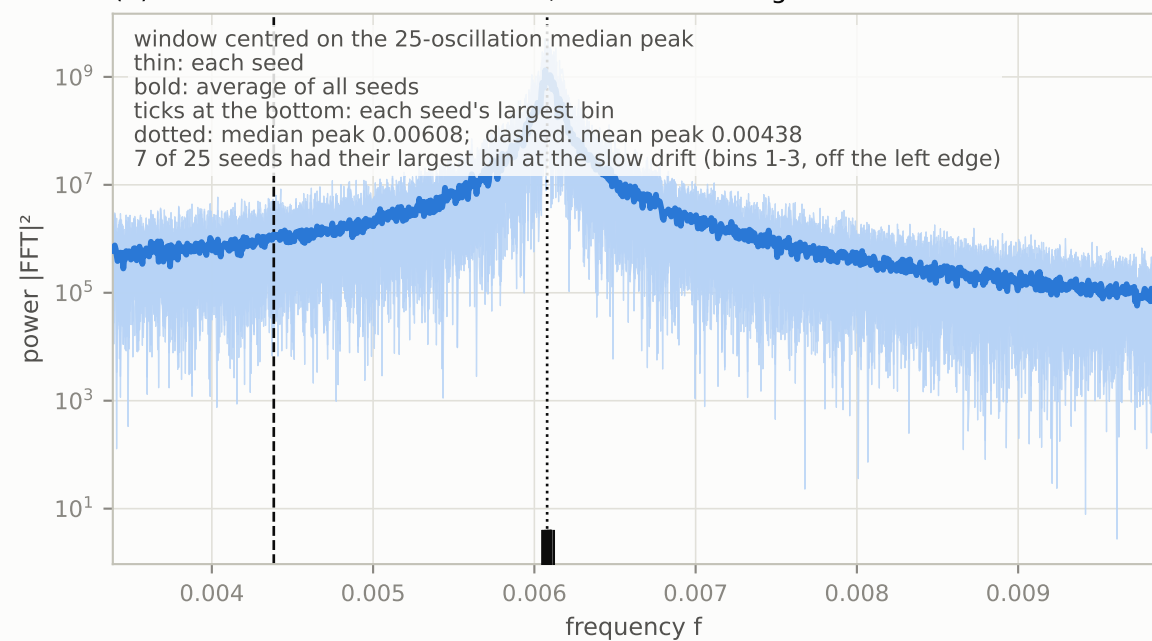

(b) the same run, whole record of 1000 oscillations

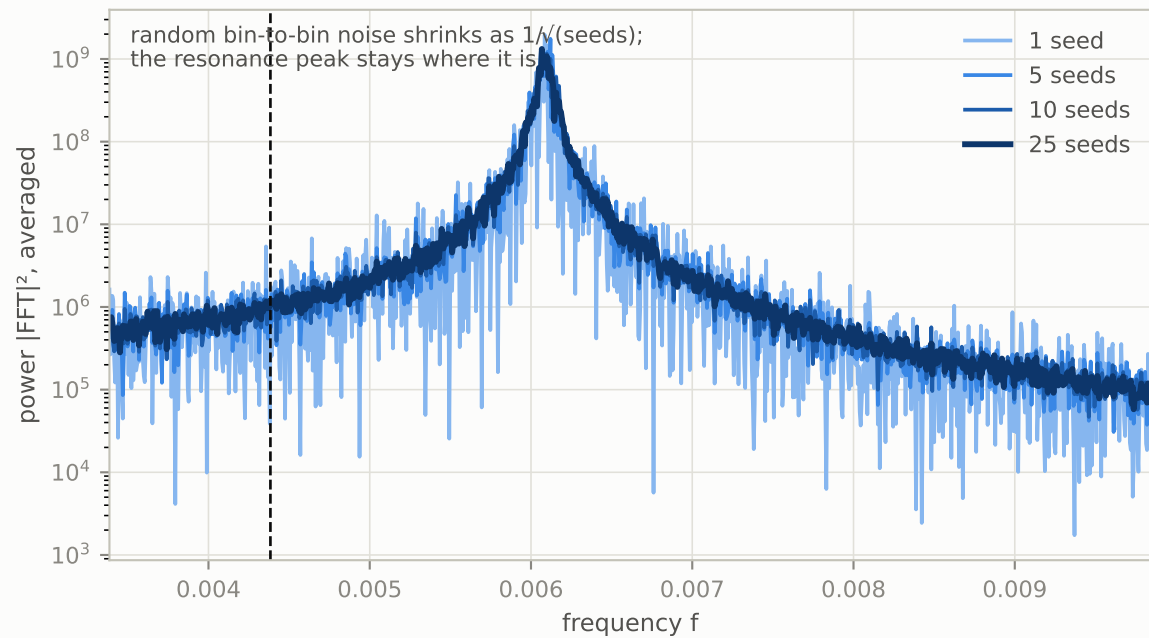

(c) FFT power spectrum of that run, whole record

(d) all 25 finished seeds overlaid, and their average

(e) the average spectrum as more seeds are added

(f) each seed's largest bin: 25 versus 1000 oscillations
